Abstract

Bakshi, Panayotov, and Skoulakis (2011) show that forward variances are predictive of real economic activity and asset returns. In this paper, we study this relation by using CBOE VIX term structure data between January 1992 and August 2009. We find that certain combinations of the 3-, 6-, and 9-month forward variances (single forward variance factor) are predictive of stock market returns at 1-, 3-, and 6-month horizons. Forward variances constructed from seven out of nine sectors are also predictive of stock market returns and real economic activity. Out-of-sample analysis confirms the prediction power of the single forward variance factor.

Keywords: Stock returns; Forward variance; Predictability

JEL classification: C5; G12; G13

∗We are especially grateful to Tarun Chordia (editor), an associate editor, and an anonymous referee, whose helpful comments substantially improved the paper. We also acknowledge helpful comments from Gurdip Bakshi, Pin-Huang Chou (the AsianFA discussant), Jin-chuan Duan, Biao Guo (the ICFDM discussant), Qian Han, Paul Hsu, Bingxin Li (the FMA Asian discussant), Dan Li, Tse-Chun Lin, Helen Lu, Weiqi Zhang (the RMC discussant), Xianming Zhou, and seminar participants at Xiamen University, University of Hong Kong, Asian Finance Association (AsianFA) and Taiwan Finance Association (TFA) 2012 Joint International Conference in Taipei, the 6th Annual Risk Management Conference (RMC 2012) in Singapore, 2013 Financial Management Association (FMA) Asian Conference in Shanghai, the 17th (2013) New Zealand Finance Colloquium in Dunedin, and the 2nd International Conference on Futures and Derivative Markets (ICFDM 2013) in Beijing.
