1. Introduction

The economic growth of Guyana vis-à-vis the remittances inflow has not received enough attention despite the fact that the remittances inflow to Guyana has been increasing at a steady pace. Over the years, remittances in Guyana have increased from an average of $US3.6 million (0.8 percent of Gross Domestic Product or GDP) in the 1982–1990 period to $US189.3 million (14.1 percent of GDP) in the 2001–2010 period (World Bank, 2012). In 2010, the remittances inflow to Guyana recorded $US309
million (13.7 percent of GDP) and was ranked 16th in the World in relative terms. Nevertheless, these inflows are understated because a significant amount of remittances flow through informal channels. The major remittance markets are USA (68%), U.K. (11%), and Canada (10%), among others (Roberts, 2006; World Bank, 2012). A summary of Guyana’s economic profile is given in Table 1.

As noted in Fig. 1, although there is a slight increase in domestic credit between 1982 and 2003, it has remained below 65 percent of GDP. Moreover, there has been some volatility in aid inflows (ODA as a percent of GDP) over the sample period. On the other hand, the remittances inflow has increased significantly since early 2000. It is also noted that the remittances inflow has been relatively stable, indicating some resilience from economic shocks.

The role of remittances in economic growth has been studied vastly. However, in the case of Guyana, the subject is not well explored. Subsequently, in this paper, we advance our study by exploring the nexus between remittances, financial deepening and official development assistance (ODA) vis-à-vis growth. We hypothesize that the remittances inflow has a plausible positive effect on growth in Guyana given its history of migration and the recent surge in remittances. However, we give equal importance to the role of financial deepening measured by domestic credit to private sectors and aid in the development process. However, their respective impacts will depend on the degree of financial depth and aid management and deployment strategies over the years, respectively. The structure of the article is as follows. Section 2 provides a brief literature survey on selected variables. Section 3 discusses the method and data. Section 4 provides regression and Granger-causality test results. Conclusions with some limitations are presented in Section 5.

### 2. Remittances, aid and financial deepening

Remittance inflows are often defined as private income sent back to the remaining family unit in the home country from one or more family members living and working abroad (Chami et al., 2006). At a global level, remittances have surpassed the official development assistance (ODA) of developing
