This research aims to update the factors influencing consumer purchase of luxury goods and, more specifically, to consider the combined effect of brand and country of origin (CoO) on the purchasing decision. This article extends an exploratory phase constructed from qualitative data previously gathered on this topic. The study includes administering a questionnaire online in seven countries (China, France, India, Italy, Japan, Russia, and the USA) to a total sample of 1102 respondents. The richness of this research relates to the possibility of an intercultural analysis of the results from seven countries. These results concern the differences in the relative importance of components of the consumer decision-making process in respect of the purchase of luxury and non-luxury goods; the relative importance of CoO for consumers making purchasing decisions relating to luxury goods; and the variation in consumers' decision-making criteria depending on the maturity of the luxury market. This research allows the authors to confirm, develop, and generalize results previously obtained in the exploratory phase of their work. They are interesting in terms of management recommendations for a company that wishes to expand internationally in a geographic area covered by the study, since the research found significant differences. The results of the research contribute also to the theoretical controversy concerning the importance of CoO in the consumer decision-making process.

1. Introduction and objectives

The effect of country of origin (CoO) on consumers’ perceptions and purchasing intentions is a common theme in marketing research (Bloemer, Brijs, & Kasper, 2009; Usunier, 2006). This research aims to update the factors influencing consumer purchase of luxury goods. The study focuses on this sector as the internationalization of business is inseparable from its economic development in recent years. In this context, brands (especially Italian and French) conventionally use the argument of CoO in their international communication strategies.

Research in consumer behavior takes two theoretical directions to explain the consumption of luxury goods. Such research initially drew on the work of social psychology to focus almost exclusively on socially oriented motivations (Dittmar, 1994; Eagly & Chaiken, 1993). Theoretical explanations based on a personally oriented vision complement this trend (Vigneron & Johnson, 1999, 2004; Wong & Ahuvia, 1998). Regardless of the perspective used, prior research in the field of luxury shows the particular importance that brands play as vectors of strategies that

Following the difficulties experienced in 2008–2009 and despite forecasts in return-to-growth in 2010–2011 (for example, Bain et al., 2011), businesses need to make smart strategic choices in international marketing. This research is part of the managerial perspective of improving understanding of the cultural differences in perception and purchasing behavior relating to luxury brands.

The study focuses specifically on the configurational effects of brand and CoO on the purchasing decisions of consumers. However, the study includes additional elements, such as design, price, and guarantee, which can influence the purchasing decisions of consumers. The choice of these variables depends on the definition of what a luxury brand is. Researchers generally agree about the lack of substantial definitions of luxury, that is to say, definitions based on general intrinsic characteristics of products and techniques employed, or on techno-economic characteristics of the industry (Bomsel, 1995). However, a certain consensus is emerging about the major characteristics that the consumer of luxury brands desires. The common denominators are beauty, rarity, quality, and price, and also an inspirational brand endorsing the product. In this context, brands compete on the basis of their ability to evoke exclusivity, brand identity, brand awareness, and perceived quality for the consumer (Phau & Prendergast, 2000).

This article complements an exploratory phase, conducted from qualitative data gathered previously on this subject (Aiello et al., 2009). The wealth of results relates to the intercultural nature of the analysis, based on a questionnaire administered in seven countries (China, France, India, Italy, Japan, Russia, and the USA), with a total sample of 1102 respondents.

After describing the conceptual framework and methodology for the study, this paper presents the results. The study firstly characterizes the specificities of the luxury market in terms of decision making, and secondly identifies important elements in this decision. At each stage, the methods chosen allow comparison of the results obtained in the different countries represented in the sample.

2. Literature review

The motivation to acquire luxury brands traditionally derives from the notion of conspicuous purchase. This idea tends still to be more or less the strategic foundation for the management of luxury brands (Comeo & Jeanne, 1997; Dittmar, 1994; O’Cass & Frost, 2002; Vigneron & Johnson, 1999, 2004). From this perspective, which has its origins in sociology and social psychology via the theory of impression management, consumers strongly orient their behavior towards the creation of a favorable social image that they can build through their purchases (Eagly & Chaiken, 1993). They then use brands as vectors to implement two distinct consumption strategies. On one hand, brands are the visible symbols that they can build through their purchases (Eagly & Chaiken, 1993). However, a certain consensus is emerging about the major characteristics that the consumer of luxury brands desires. The common denominators are beauty, rarity, quality, and price, and also an inspirational brand endorsing the product. In this context, brands compete on the basis of their ability to evoke exclusivity, brand identity, brand awareness, and perceived quality for the consumer (Phau & Prendergast, 2000).

2.1. Country-of-origin effect on consumer perceptions and purchasing behaviors

Previous researchers working on the effects of CoO take two complementary directions. On one hand, they consider the composition of product–country images (Agrawal and Kamakura, 1999; Roth and Diamantopoulos, 2009; Roth and Romeo, 1992; Usunier and Cestre, 2007). On the other hand, they have an interest in how consumers use CoO as an evaluation of product quality (Bloemer et al., 2009; Veale and Quester, 2009; Verlegh et al., 2005). This article is part of this second perspective, and examines the influence of CoO on perceptions and purchasing intentions of consumers in the field of luxury goods.

According to Bilkey and Nes (1982), one of the most popular approaches towards the use of CoO-cues is the cognitive approach, which sees a product as a cluster of cues. This approach usually distinguishes between product-intrinsic cues (such as taste, design, material, and performance) and product-extrinsic cues (such as price, brand name, store reputation, warranty, and CoO).

Research has shown that consumers generally rely more on intrinsic attributes when forming their opinions. However, in certain circumstances, consumers prefer extrinsic attributes, finding them more credible and reliable than their own assessment (Srinivasan et al., 2004). The use of extrinsic attributes can also relate to situational factors, especially when status or self-image affects the purchase of a product (Piron, 2000; Quester and Smart, 1998).

The CoO impacts consumer perceptions and behaviors through the image of the product’s CoO. The image is the representation, reputation, or stereotype of a specific country, which consumers associate with the products (Nagashima, 1970, 1977). According to Roth and Romeo (1992), a country’s image arises from a series of dimensions that qualify a nation in terms of its production profile. Such dimensions include innovative approach (superior, cutting-edge technology); design (style, elegance, balance); prestige (exclusive-ness, status of the national brands); and workmanship (reliability, durability, quality of national manufacturers). Usunier (1993, 2006) provides a more comprehensive definition of the country image as a multidimensional construct influenced by cognitive components, affective components, and stereotypes. The strong associations between the country image and product quality in relation to product/brand evaluations (Kotler and Gertner, 2002) necessitate the identification of how global consumers perceive the redefined concept of CoO. They perceive the CoO as the country of design (CoD), and as the country of manufacture/assembly (CoM/A). The use of different products in different countries causes contradictory findings in
