\section{Introduction}

Many of today’s managers are concerned about their online image. Scholars have been equally concerned about the emergence of consumer-generated feedback and have studied topics such as consumer decision-making (Sparks and Browning, 2011; Williams et al., 2010; Vermeulen and Seegers, 2009; Pavlou and Dimoka, 2006), online image (Schmallegger and Carson, 2007; O’Connor, 2010), responses to online complaints, and the operational uses of online reviews (Torres et al., 2013). Despite the amount of resources devoted to monitoring online feedback in the lodging industry and the amount of time and efforts scholars have devoted to conducting research, little is known about the impact of such feedback on incremental revenue generation. Among the emerging literature in this subject is a study by Ye et al. (2009) in which a mathematical model was developed to explain the impact of user-generated comments on hotel sales and profitability. Other researchers have explored the relationship of positive reviews and traffic to the business’ website (Zhang et al., 2011). Despite the existing studies, more research is needed to demonstrate the effects of word-of-mouth communications in hotel bookings.

Concern for word-of-mouth communications (WOM) is not a new phenomenon. However, the existence of various channels to express consumer feedback has stirred a new wave of attention on the topic. Westbrook (1987) defined word-of-mouth as: “informal communications directed at other consumers about the ownership, usage, or characteristics of particular goods and services and/or their sellers” (p. 261). Researchers have posited that WOM has the potential to impact consumer purchase decisions, customer acquisition, and consequently result in increased revenue for organizations (Litvin et al., 2008; Trusov et al., 2009).

It can be argued that one of the goals of management research is to provide tools for current and future business leaders to make intelligent evidence-based decisions. Additionally given the investment that companies put forth toward maintaining a positive online image, it would be prudent to examine the likely returns from such efforts. Although research has started to examine financial performance measures as a consequence of consumer-generated feedback, many of these studies use proxy data to estimate actual financial measures. While this can be helpful in drawing attention to the research problem, the present study adds value by utilizing actual revenues from booking transactions. Additionally, while other studies have tried to link ratings to REVPAR (Blal and Sturman, 2014), the present research examines the impact of rating, ranking and number of reviews on a hotel’s ability to generate revenues through its booking transactions. In light of this, it can be stated that the purpose of this study is to explore the impact that a hotel’s firm rating, relative ranking, and the overall number of reviews have on the average value of each booking transaction. Arguably, the present study can contribute to both the theory and practice of hospitality by exploring the links between...
various trends and practices and the hotel’s financial measures. The following research objectives were proposed:

- To assess the impact of consumer-generated feedback on booking transactions.
- Evaluate the role of a hotel’s relative ranking on booking transaction.
- Exploring the impact of the number of reviews on booking transactions.

2. Literature review
2.1. The financial outcomes of online feedback

While small in size, a nascent stream of literature exists to explore the role of online feedback on financial performance. As an example; Ye et al. (2009) developed a mathematical model to explain the impact of user generated comments on hotel sales and profitability. Accordingly, a 10% improvement in reviews led to a 4.4% increase in sales. In a similar vein, Brian Ferguson (Executive Vice-President of Expedia) disclosed that according to his records “A one- point increase in a review score equates to a 9% increase in ADR” (Lynch, 2012). The preliminary evidence proposed by both this mathematical model, as well as the data collected by industry professionals in online travel agencies, suggests that an impact exists between positive reviews and revenues. At the present time TripAdvisor is a very prominent online review site for hotels. Using consumer feedback, TripAdvisor (2013) applies a proprietary formula to assign hotels a ranking. Accordingly, this formula takes into account the number of reviews, age of the reviews, and quality (valence) of the reviews. Nevertheless, given the proprietary nature of such formula, the amount of emphasis placed on each factor, as well as any other factors not explicitly disclosed to the public is unknown.

Blal and Sturman (2014) studied the impact of ratings and volume of reviews on REVPAR. They demonstrated that there was a significant impact of ratings on the revenues per available room. However, the number of reviews did not account for a significant shift. Blal and Sturman (2014) used a sample in London and thus the present study expands upon the existing knowledge by using a cross section of hotels in the United States. The present study examines a lodging establishment’s financial data as measured by the average transaction size (in dollars). As such it provides a unique contribution, as higher transactions could potentially signify a customer’s willingness to pay a premium for a room. Additionally information from TripAdvisor which was publicly available online, was used to explore the impact of ratings and number of reviews on the average size of an online transaction.

Hotels receive quality feedback from various stakeholders including consumers, experts, and internal sources. Torres et al. (2013) explored the operational implications of such feedback. Furthermore, the researchers discovered that the ratings of consumers and experts had been positively correlated with the perceptions of quality improvement of hotel General Managers. Ogut and Tas (2012) examined the impact of both expert ratings (in this case online ratings), and consumer ratings (through comments posted in an online travel agency). Such study sought to understand the impact of experts and consumer’s opinions on hotel sales in two major tourist destinations: Paris and London. In a similar manner than Ye et al. (2011), researchers Ogut and Tas (2012) utilized the number of reviews as proxy for sales. Their findings suggest that consumer ratings impact the number of reviews more so than the ratings of experts. Of greater importance is the fact that the authors discovered that the variability in such comments was not as critical as the overall rating given by consumers in terms of generating excitement through social media; however it is not clear whether hoteliers would get a return on the investment they make in such activities. Ye et al. (2011) conducted an additional study in which they sought to explore the impact of positive online reviews on hotel sales. Nevertheless, due to the lack of financial data, the number of reviews was used as a proxy for hotel sales. Their study demonstrated that a higher valence of the average review rating leads to an increased number of reviews. Furthermore, they discovered that the variability in such comments was not as critical as the overall rating given by consumers in terms of generating a greater number of reviews (Ye et al., 2011).

Hotels receive quality feedback from various stakeholders including consumers, experts, and internal sources. Torres et al. (2013) explored the operational implications of such feedback. Furthermore, the researchers discovered that the ratings of consumers and experts had been positively correlated with the perceptions of quality improvement of hotel General Managers. Ogut and Tas (2012) examined the impact of both expert ratings (in this case online ratings), and consumer ratings (through comments posted in an online travel agency). Such study sought to understand the impact of experts and consumer’s opinions on hotel sales in two major tourist destinations: Paris and London. In a similar manner than Ye et al. (2011), researchers Ogut and Tas (2012) utilized the number of reviews as proxy for sales. Their findings suggest that consumer ratings impact the number of reviews more so than the ratings of experts. Of greater importance is the fact that the authors demonstrated a positive relationship between consumer ratings and the lodging establishment’s average price of a standard double room during the data collection period (Ogut and Tas, 2012).

A business’ online reputation can be positively or negatively affected by online feedback. Seeking to explore the impact of electronic WOM in the ability to generate price premiums, Ba and Pavlou (2002) conducted both an experimental and a field study.
