Abstract

The literature has found contradictory results regarding the impact of human resource management on project success. This paper focuses on one important human resource management process – team development – to investigate its importance in the project environment. Results show that most team development practices that work well in the operational business environment do not have a significant influence on project success. However, project duration was found to moderate the relationship between team development and project success: the effectiveness of team development increases in longer projects. The paper identifies and analyzes team development practices that have a positive impact on project success exclusively in long projects.

Keywords: Project management; Human resource management; Project teams; HRM; Groups

1. Introduction

Human resource management (HRM) practices are critical for organizational success (Banker et al., 1996; Dulebohn and Martocchio, 1998; Newell et al., 2004). However, their importance in the unique project environment is still unclear. On the one hand, the literature has identified HRM as an important factor towards project success (e.g. Tampoe and Thurloway, 1993; Barczak and Wilemon, 1992; Thamhain, 2004a) and a core element of project management bodies of knowledge (e.g. Kerzner, 2009; Meredith and Mantel, 2009; PMI, 2008). On the other hand, several recent empirical studies found HRM to have a limited effect on project success (e.g. Pinto and Prescott, 1988; Belout and Gauvreau, 2004; Ebtehaj and Afshari, 2006). In order to explain these contradictory results, the purpose of this study was to further investigate the effectiveness of HRM in the project environment in general, with particular reference to exclusive project scenarios (Zwikael, 2008). In other words, this paper aims to explore the circumstances under which HRM practices are more effective towards improving project success.

Because HRM is a vast area, which has both a management support role and an employee support role (Turner et al., 2008) this paper does not intend to cover all its related processes. For example, the PMBOK (PMI, 2008) identifies four project HRM processes: develop human resource plan, acquire project team, develop project team, and manage project team. This paper focuses on team development, as the existing literature recognizes it as critical for organizational and project success (Kerzner, 2009; Weinkauf and Hoegl, 2002). Team development is under the direct responsibility of the project manager, who is expected to engage in activities such as training, and rewarding.

In order to better understand the role of team development in various type of projects, the objectives of this paper are to: (1) explore the contribution of different team...
development practices to project success; (2) identify those
team development practices that have the greatest influence
on project success; and (3) investigate potential moderating
variables that may influence the relationship between team
development and project success. As a result, this paper
aims at improving the knowledge on team development
effectiveness in general and across different project scenar-
ios in particular. The following sections review the relevant
literature and present the research model, hypotheses,
results, implications, and contribution of this study to
theory.

2. Literature review

This section reviews the relevant literature in the areas
of teams, project teams, and project team development.

2.1. Teams

With the growing complexity of the work environment,
many organizations have reconstructed individual work
procedures into team processes to increase productivity
and enhance organizational effectiveness (Banker et al.,
1996; Dulebohn and Martocchio, 1998; Katzenbach and
Smith, 1993; Mohrman et al., 1995; Newell et al., 2004).
A team is defined as “a small number of people with com-
plementary skills who are committed to a common pur-
pose, performance goals and approach for which they are
mutually accountable” (Katzenbach and Smith, 1993).
Team members have specific roles or functions and the life
span of membership is limited (Cannon-Bowers and Salas,
1998).

Six types of work teams have been identified in the
group and team literature: project, production, service,
action/performing, management and advisory teams
(Hackman, 1990; Sundstrom et al., 2000). Due to its com-
plexity and uniqueness, the first type – project teams – is
what we focus on in this paper.

2.2. Project teams

As project teams are a unique type of teams, Huemann
et al. (2007) suggested the conditions under which HRM
emerges in the project-oriented organization may differ
from those associated with mainstream HRM. A project
is defined as any series of activities and tasks that have a
specific objective to be completed within certain specifi-
cations, have defined start and end dates, and have funding
limits (Kerzner, 2009). Project teams carry out defined, spe-
cialized, time-limited projects that disperse upon comple-
tion of project (Chen et al., 2004). This creates a dynamic
work environment, where additional pressures can be
imposed on the employee from fluctuating work-loads,
unknown requirements, and multiple role demands (Turner
et al., 2008).

Members of project teams tend to come from different
departments or units within the organization, as is appar-
ent in project and new product development teams (Sund-
strom et al., 2000; Richards and Moger, 2000). In many
instances, project teams are comprised of white-collar pro-
fessionals who collaborate on an assigned or original pro-
ject. However, it should be noted that the fact project
teams operate in various contexts and industries and within
different organizational structures (Kerzner, 2009; Dvir
et al., 2006) also affects the way these projects should be
managed. Furthermore, the tasks that project teams engage
in usually involve the application of considerable knowl-
dge and expertise (Simpson, 2006). Such project teams
have been associated with high levels of innovation and
autonomy (Sundstrom et al., 1990).

Project teams are generally cross-functional (Cunning-
ham and Chelladurai, 2004; Chen et al., 2004; Cohen and
Baily, 1997). Research has supported many positive out-
comes to cross-functional project teams. These include
greater external communication and technical quality
(e.g. Keller, 2001), creativity (Jassawalla and Sashittal,
1999), and group performance (Pelled et al., 1999). How-
ever, the literature has also demonstrated negative out-
comes for these teams, including lower levels of cohesion
(Jehn, 1997), slower reaction times (Hambrick et al.,
1996), increased costs (AitSahlia et al., 1995), and
employee stress (Keller, 2001). Few researchers have even
gone as far as to suggest that cross-functional teams have
the potential to “worsen morale, exacerbate divisiveness,
and elevate cynicism among participants” (Jassawalla
and Sashittal, 1999).

2.3. Project team development

Project team development is the process of improving
the competencies, team interaction, and the overall team
environment to enhance project performance (PMI,
2008). This process transforms a collection of individuals
with different needs, backgrounds, and expertise into an
integrated, effective work unit (Thamhain and Wilemon,
1987). As a result, team leadership skills are important
for project managers (Turner and Müller, 2006; Müller
and Turner, 2007).

There are three phases in development of project teams
(Weinkauf and Hoegl, 2002). The first phase is referred to
as the “conceive phase”. During this phase, the project
manager and the team focus on project goal-setting, deter-
mination of approach, and resource planning. This is fol-
lowed by the “organizing phase” in which the manager
and team members engage in boundary establishment,
delineation of relationships, team task design, determina-
tion of values and norms and the securing of resources.
Finally, during the “accomplish phase”, most of the activ-
ities are directed towards enabling the team members to
work together as effectively as possible in order to success-
fully complete the project at hand. Leadership roles, such
as direction, effective communication, autonomy, accom-
plishment, recognition, and the defining of clear organiza-
tional objectives, have been shown to have a strong
