## Abstract

Lately, the use of gas turbines following the deregulation of the electricity supply industry has quickly become greater. The motivation for modeling gas turbines and their controllers is the need to interpret their impacts on distribution systems. Model predictive control (MPC) is used to damp the oscillation when the power distribution system is subjected to a disturbance. MPC is selected because it can explicitly handle the nonlinearities and constraints of many variables in a single control formulation. The IEEE 13 node power distribution system is employed to demonstrate the effectiveness of MPC to damp the oscillations of gas turbines.

## 1. Introduction

Gas turbines can offer solutions to today's energy situation as a supplement or support function to the conventional central generation and power system [1]. Complimentary answers are needed to meet the projected growth in new load and peak demand while providing power system stability, security and end user power quality solutions. Distributed generation (DG) integration into the existing power grid can enhance asset utilization without demanding major capital investment in new large generation or energy delivery facilities.

Synchronous machine stability surveys have been a discipline of interest for many years. Much of the work produced has been based on steam or hydro turbine generating units. Power system stability is normally associated only with large utility systems. However, with DG operating in parallel with the utility, stability has become an issue that is crucial to preserve critical functions [2]. Compared to the transmission system, the distribution system has several important characteristics. The power of DG is relatively small compared to the capacity of the substation. The substation is stiff enough to keep the frequency constant and, thus, can be conceived as an infinite bus.

## Nomenclature

$A_o$	compressor exit flow area (m <sup>2</sup> )
$a, b, c$	valve parameters
$c_{pa}$	specific heat of air at constant pressure (J/(kg K))
$c_{pg}$	specific heat of combustion gases (J/(kg K))
$c_{ps}$	specific heat of steam (J/(kg K))
$e_1$	valve position
$F_d$	fuel demand signal
$K_I$	PID parameter
$K_P$	PID parameter
$k_f$	fuel system gain constant
$k_{LHV}$	factor that depends on LHV
LHV	lower heating value (MJ/kg)
$m_a$	polytropic index
$N$	rotation speed of the turbine (rad/s)
$P_c$	compressor power consumption (W)
$p_{cin}$	air pressure at compressor inlet (Pa)
$p_{cout}$	air pressure at compressor outlet (Pa)
$P_m$	mechanical power delivered by turbine (W)
$P_T$	total mechanical power delivered by turbine (W)
$p_{Tin}$	pressure of combustion gases at turbine inlet (Pa)
$p_{Tout}$	pressure of combustion gases at turbine outlet (Pa)
$r_c$	pressure ratio (outlet/inlet)
$t$	time (s)
$T$	mechanical torque delivered by turbine (N m)
$T_{cout}$	outlet air temperature (K)
$T_{is}$	temperature of injected steam (K)
$T_{Tin}$	turbine inlet gas temperature (K)
$U(t)$	control signal
$Y_T, U_T$	finite time Fourier transforms
$w_a$	air mass flow into the compressor (kg/s)
$w_f$	fuel mass flow (kg/s)
$w_g$	turbine gas mass flow (kg/s)
$w_{is}$	injection steam mass flow (kg/s)
$\Delta h_{25}$	specific enthalpy of reaction at reference temperature of 25 °C (J/kg)
$\Delta h_{IC}$	isentropic enthalpy change for a compression from $p_{cin}$ to $p_{cout}$ (J/kg)
$\Delta h_{IT}$	isentropic enthalpy change for a gas expansion from $p_{Tin}$ to $p_{Tout}$ (J/kg)
$\Delta N$	rotation speed deviation of the turbine (rad/s)
$\eta_c$	overall compressor efficiency
$\eta_T$	overall turbine efficiency
$\eta_{trans}$	transmission efficiency from turbine to compressor
$\eta_{\infty c}$	compressor polytropic efficiency
$\rho_i$	inlet air density (J g/m <sup>3</sup> )
$\tau_f$	fuel system time constant (s)

Model predictive control (MPC) is a control strategy that uses a model of the system to predict the response over a future interval, called the costing or prediction horizon [3–5]. The application of MPC to control the gas turbine was introduced by van Essen [6] and Vroemen [7]. Model based control schemes are highly related
