Abstract

This article points out the importance of the using of green building materials in China. The selection of green building materials has deep relationship of the regional endowments differences. It requires a combination consider of regional to build the index system. This paper introduces the data envelope method to solve the evaluation of green building materials. The proposed evaluation process also been given.

Keywords: the regional endowments; green building materials; evaluation; DEA

1. Introduction

Under the guidance of “Area Non-equilibrium Development Strategy”, China's economic and social development has made brilliant achievements after 30 years of reform and opening up. However, the consequent widening gaps between the levels of regional economic drawback the wealth polarization of serious inefficient allocation of resources. They also make many other social problems [1]. Especially in the field of construction, the large number using of high energy consumption and high pollution building materials caused tremendous damage to the social environment.

With the rapid development of the construction industry, the building materials used in the construction enterprise are more and more. The quantity to the type and functional direction keeps increasing as well as the requirements of building materials. In the study of the problems in China, most scholars reached a conclusion: "Consensus of the various regions in China due to be adjusted according to its own characteristics of building materials using standard". In general, the regional economic disparity includes two aspects: First, the regional differences in physical geography and economic geography [2]. The differences determine the regional economic condition and factor endowments in the broad sense. Thus, they determine the various regions in the country and the division status in the world economy. These differences include: the latitude and longitude, waterfront location, climatic zone, the temperature, rainfall, topography, mineral, property, the environment, industry characteristics, construction characteristics, population, ethnicity, socio-system and economic fiscal position. The second aspect is the level of economic development. It means the regional economic development of the economies of scale with the current dynamic [3]. The first factor of endowments difference is the determinants of regional economic differences. The second aspect of the differences is in factor endowments differences [4-5]. The main raw material of green building materials belongs to the natural resources. Thus it is an important part of the regional factor endowments. Study on green building materials and regional natural endowments characteristics is of great significance for further development. It is also important to improvement of regional architectural development theory.

2. Green building materials theory

The application of building materials theory includes green building materials, bio-materials and eco-friendly materials theory. It builds strategy in the China region economic development and provides a theoretical basis. However, there are many problems to be solved, such as: one-sided emphasis on inter-regional differences inevitability and absolute; ignoring the positive role of balanced development; lack of the development of non-equilibrium representative theoretical contradictions; the three forces in promoting the development of housing construction: inherent laws of economic development, market mechanisms and government intervention; the optimal limit [6]. Neoclassical regional opposition balanced economic development theory based on a series of assumptions: regional economic development and the role of the market mechanism. The theory is satisfied through the accumulation of capital in the region and inter-regional flow of production factors will eventually tend toward equilibrium. However, the regional differences theory in natural endowments contradicts the reality hindrance of the flow of production factors. The market mechanism alone is difficult to achieve a balanced development of the regional economy. However, the objective laws of economic development and practical experience shows that China is still in non-equilibrium for a long period. The use of the non-equilibrium development theory guides the development of the regional economy. Especially, the use of the process of building materials must be combined with the regional economic characteristics. Eastern coastal areas should continue to play a leading role. The Central special preferential policies are also basically unchanged. In short, the using of building materials and regional resource endowments has a close relationship. There are significant differences in regional resource endowments. Overall equilibrium development objectives of the national economy or the regional economy are bound to achieve through local non-equilibrium development. Successful examples of economic development, such as the United States, Australia and other countries also confirm this conclusion [7]. The equilibrium development theory and non-equilibrium development theory are involved the coordinated development of the concept. The ultimate goal of them is to achieve a balance of overall economic and social. The use of building construction costs and the needs of relevant are also delivered to the building construction materials. It is necessary to give full consideration to these aspects. These considerations also provide a reference to the evaluation method of green building materials.
