ABSTRACT

The purpose of this paper is to develop and apply a methodology for identifying, assessing and segmenting customers for business solutions. Firstly, criteria for evaluating solution customers are identified from the literature. These criteria are then refined and differentiated through interviews with 23 solution project managers. Secondly, a longitudinal case study with three solution suppliers and five of their customers is conducted to transfer the selection criteria into a managerial methodology which is validated by both solution suppliers and customers. The developed methodology comprises 21 criteria which are structured into two dimensions: the quality of the relationship to date and the customer's potential for future solution partnership. By combining these two dimensions into a portfolio analysis, four customer segments are identified to help suppliers determine customer attractiveness. The study's contribution lies in bridging academic knowledge and managerial practice to develop a new methodology for helping solution providers to make better informed decisions and reduce the risk of solution failure.

1. Introduction

Offering solutions is an increasingly popular strategy in business-to-business markets. Companies such as Caterpillar, Michelin and Rolls-Royce are examples of companies that have transitioned from selling stand-alone products to selling solutions successfully. Rolls-Royce Aerospace, for example, offers airline customers an alternate to the outright purchase of aero engines. Instead, airlines can pay for 'engine by hour of flight' whilst allowing Rolls-Royce to manage the maintenance of the engine remotely 24/7 during flight. This contributes to a smooth operation of the airlines' flight schedules and increases aircraft availability (Rolls-Royce, 2015). Caterpillar's coal mining fleet management supports its customers' operations with real-time machine tracking, assignment and productivity management. It works with all types of assets and equipment, contributes to reductions in costs per ton and enhances productivity (Caterpillar, 2012).

The literature on business solutions is emergent and extant definitions of business solutions contain different perspectives. The majority of definitions state that it is an integrated combination of products and/or services that address a customer's business needs (e.g. Bastl, Johnson, Lightfoot, & Evans, 2012; Brady, Davies, & Gann, 2005; Brax & Jonsson, 2009; Davies, Brady, & Hobday, 2007; Johnstone, Dainty, & Wilkinson, 2009; Sawhney, 2006; Windahl & Lakemond, 2006, 2010). In other words, a solution is an offering that integrates different components and contains an outcome focus. Some definitions also assert that solutions are co-created with customers (e.g. Cova & Salle, 2008; Evanschitzky, Wangenheim, & Woitschläger, 2011; Nordin & Kowalkowski, 2010; Salonen, 2011). Others take a process view, stating that business solutions are a set of customer-supplier relational processes (e.g. Storbacka, 2011; Töllner, Blut, & Holzmüller, 2011; Tuli, Kohli, & Bharadwaj, 2007). We argue that none of these perspectives alone captures the nature of solutions sufficiently. Firstly, by simply positing that a solution is an integrated combination of products and services, the concept is not differentiated from that of product bundling. Stremersch and Tellis (2002, 57) define product bundling as “the integration and sale of two or more separate products or services at any price”. As with solutions, the integrated nature of product bundles is supposed to provide value that is greater than the sum of the individual components (Stremersch & Tellis, 2002). Secondly, the co-creation view by itself does not distinguish solutions from other types of service offerings (Nordin & Kowalkowski, 2010). From a service logic perspective, this applies to all kinds of services irrespective of whether they are solutions or less complex offerings (c.f. e.g. Grönroos, 2011; Normann, 2001; Vargo & Lusch, 2004). We therefore argue that solutions have to combine the defining elements discussed in the literature. The definition by Ulaga and Reinartz (2011) best meets this requirement. The authors define solutions as offerings supporting the customer’s processes with a value proposition that relates to achieving a result (Ulaga & Reinartz, 2011, 17). Furthermore, they point out that solutions integrate goods and services and comprise customer involvement. We extend their
The objectives are to develop a solution strategy for selecting customers and to help managers evaluate the suitability of prospective solution customers before going down this path. The purpose of this study is to provide a framework and methodology for executing business-to-business relationship marketing, and customer integration into innovation processes. Secondly, we present the methodology, an interaction research approach (Gummesson, 2002) consisting of two parts. The first part comprises semi-structured interviews with 23 managers of international solution providers. The objective is to refine, specify and differentiate the literature-derived insights. The second part consists of a longitudinal case study with three solution suppliers and selected customers. The aim is to transform the selection criteria into a managerial methodology which is validated by both solution suppliers and customers. Thirdly, we present and discuss the findings. The final set of solution customer selection criteria comprises 21 criteria relating to the past customer-supplier relationship and the potential of the customer as a future solution partner. Finally, we conclude the paper by outlining managerial and theoretical implications.

2. Literature review: criteria for solution customer selection

In order to identify assessment criteria for segmenting solution customers, not only literature on business solutions, but also literature in the related fields of key account selection, relationship marketing and customer integration into innovation processes has been considered. The criteria we derived from the literature can be structured into seven areas: Customer paying and investment behaviour, supplier contacts within the customer organisation, customer attitude towards the business relationship, customer competency as a value co-creator, customer attitude towards joint innovation with the supplier, customer industry and solution replication potential (cf. Table 1). Before we elaborate on the criteria in more detail, it is important to point out that business practice shows that essential solution criteria, such as trust, must be in place before any extended value proposition is likely to be implemented.

One financial consideration for suitable solution customers relates to the customer’s practice of paying on time without having to be chased for the payment. This creates a satisfactory exchange performance for the supplier (Han, Wilson, & Dant, 1993). Another financial aspect relates to the customer being both able and willing to invest sufficient funds in the relationship to ensure an economically viable relationship development (Adamson, Dixon, & Toman, 2012; Campbell & Cunningham, 1983; Everhartz, Maiwald, & Wieseke, 2014; Ojasalo, 2001). From a solution perspective, both criteria are important because potentially high up-front investments on behalf of the supplier stress the need for secure returns and hence customer payment reliability.

2.2. Supplier contacts within the customer organisation

In contrast to goods sales, business solution offerings tend not to follow pre-defined customer specifications and are seldom well defined from the beginning. Rather, they call for strong customer involvement and co-creation to elaborate the offering (Ulaga & Reinartz, 2011). Also, the implementation of business solutions is likely to affect various actors within the customer organisation in different ways and some may benefit more from the solution than others (Macdonald, Wilson, Martinez, & Toossi, 2011). Therefore, the supplier should have contacts to the key personnel within the buyer organisation. Contacts to actors at the top management level are crucial since these strategic decision makers tend to see the potential gains from solutions more readily (Ulaga & Reinartz, 2011). In addition, Michel, Brown, and Gallant (2008) differentiate the roles of solution buyers, users and payers. Learning about their individual needs and requirements is essential in order to be able to “develop the right argument for the right person” (Ulaga & Reinartz, 2011, 13). Adamson et al. (2012) distinguish
