Abstract
This paper explores the bond flows dynamics for a set of Emerging Market Economies. It documents that these flows have, in general, positive co-movements, and exhibit risk-reversals, and negative feedback with their associated risk premiums. A number of mechanisms could explain these features. However, we find evidence that lends support to the presence of the risk-taking channel. In particular, we find indications that unexpected changes in US monetary policy affect such dynamics, and that their effects seem to have grown with the size of the international investors’ position in Emerging Market Economies’ bonds. The main results are robust to different measures of the US monetary policy stance, and to the use of macroeconomic and financial variables as controls. Our broader interest is the potential financial stability risks building up, which could materialize as US monetary policy normalizes.

Key Words: Bond flows, emerging market economies, US monetary policy, risk-taking channel, financial stability.

JEL Codes: F3, F4, G1, E5, and C7.

2 We would like to thank two anonymous referees for their valuable comments. We would also like to thank the organizers and participants of the conference on “Network models, stress testing and other tools for financial stability monitoring and macroprudential policy design and implementation”, in particular, Camelia Minoiu, our discussant. The Financial Stability, the Central Bank Operations and the Economic Research Directorates at the Banco de México provided us with some of the data. Conversations with Raúl Alvarez, Santiago Bazdresch, Andrés Jaime, Fabrizio López-Gallo, Lautaro Silva, Claudia Tapia Rangel, and Ariadna Valle Carmona were useful. José Manuel Sánchez provided superb research assistance.
