This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

In this paper, we propose several parallelization schemes having different parallelization levels that exploit both the CPU and the GPU at the same time leading to increase the GPU occupation over time i.e. at each time several CPU processes can use the GPU at the same time while others exploit the CPU and yet others perform data transfer between CPU and the GPU which allows us to achieve a good relative speed-up.
