This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

- This study examines the relationship between suitability of mates and exercise.
- To control for time-varying unobservables, a quasi-triple difference is used.
- Specifically, within a marriage market year, we difference single vs. married women.
- A 10 pp increase in 'unsuitable' men reduces single black women's exercise by 10%.
- Results are insignificant for white women.
