This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The global minimum variance portfolio is estimated using random matrix theory.
- This approach leads to a shrinkage-type estimator which is distribution-free.
- It is optimal in the sense of minimizing the out-of-sample variance.
- The assumption of the existence of the fourth moments is only needed.
- The resulting estimator shows significant improvements to the existent estimators.
