This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights:

1. A nonlinear dynamic model of a planetary gear system is established, considering time-varying meshing stiffness, comprehensive gear error and gear backlash.
2. The numerical simulation focuses on the effects of excitation frequency and comprehensive gear error.
3. The different parameters have different influences on the motion of the planetary gear system.
4. The results indicate the suitable coefficients should be specified so that chaotic behavior can be avoided.
