The Nature of Social Learning: Experimental Evidence

Stefan P. Penczynski*
University of Mannheim

June 2016

In the wide economic literature on social learning, many types of behavior – rational and non-rational – have been proposed. I suggest a level- k model that unifies many of them in one framework. This paper analyzes experimental data that is able to distinguish between levels of reasoning at the individual level. It relies on rich, existing data from Çelen and Kariv (2004) as well as new experimental data that includes written accounts of reasoning from incentivized intra-team communication. Three datasets provide consistent evidence that naïve inference in form of the best response to truthful play is the most common approach to social learning. The empirical type distributions feature heterogeneity similar to other level- k applications.

Keywords: Social learning, levels of reasoning, naïve inference

JEL Classification: C91, D82, D83, D84

I thank the editor and two anonymous referees for their detailed comments. I further thank Ayala Arad, Konrad B. Burchardi, Dirk Engelmann, David Gill, Rosemarie Nagel, Anders Poulsen, David Rojo Arjona, Robert Sugden and seminar participants at ESA Chicago 2011, University of East Anglia, SABE Granada 2012, HeiMaX Heidelberg 2012, GfW Karlsruhe 2012, M-BEES Maastricht 2012, and University of Mannheim for helpful comments. I also thank Shachar Kariv and Boğaçhan Çelen for the provision of the data from their 2004 study. Katharina Momsen, Allison Nuñez, Dennis Shiraev, and Julia Walecki provided excellent research assistance.
