This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

ACCEPTED MANUSCRIPT

Highlights

- A methodology has been developed for natech risk assessment of industrial plants.
- Flotation, shell buckling, and rigid sliding are considered as prevailing failure modes.
- Physical reliability models and Monte Carlo simulation are used to generate artificial failure data.
- Bayesian parameter learning is used to estimate and combine failure probabilities.
