Interactions between immunotoxicants and parasite stress:
implications for host health

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We present a model to describe the within-host dynamics of an organism under both immunotoxicant and parasite stress.
- We consider both the direct toxicity and indirect sub-lethal immunosuppression of toxicants.
- Sub-lethal exposure to toxicants can rapidly promote an already-present parasite infection, through the suppression of the immune system.
- We find that within-host parasite density is maximised by an intermediate toxicant level, depending upon the relative strength of immunosuppression and toxicity.
- We classify the breakdown of the within-host dynamics into three phases of increasing toxicant stress, which are determined by the relationship between the statuses of immunity, cellular health and level of toxicant exposure.
- We discuss the implications of our model in the context of individual bee health under multiple stressors.
