Abstract

Background

Research has documented heterogeneous developmental trajectories of specific symptoms, such as anxiety and depression, in late childhood and adolescence. Few studies, however, have examined the heterogeneity of general psychopathology (GPP) trajectories considering symptoms of anxiety, depression, and hostility in adolescence simultaneously. Identifying antecedents for distinct trajectory groups of GPP, and their respective consequences, may provide insight into the etiological underpinnings of social antecedents of different symptoms and inform the targets and timing of intervention.

Methods

European American target adolescents (N = 444, 53% female) evaluated three domain specific symptoms (i.e., symptoms of anxiety, depression, and hostility) as well as psychosocial risks and social consequences over 10 years (from 1990 [Wave 2] to 2001 [Wave 13]). First- and second-
