Abstract

Introduction

Increased affective reactivity to daily life stress has been found in individuals with psychosis and depression, and in those at risk for these conditions. Because depressive and psychotic symptoms often co-occur, increased affective reactivity in these disorders may be explained by the presence of depressive symptoms, psychotic symptoms, or both. Therefore, we examined whether affective reactivity to daily stress is related to positive psychotic symptoms, independently of depressive symptoms, and vice versa.

Methods

We used data from an intensive sampling study in the general population (n=411), with three measurements a day (t=90). The following subjective stressors were assessed: appraisal of
