This work was approved by the University of Notre Dame Institutional Review Board, and this work was supported by a University of Notre Dame Institute for Scholarship in the Liberal Arts Graduate Student Research Award awarded to Kasey Stanton.

Abstract

Background

The Mood Disorder Questionnaire (MDQ; Hirschfeld et al., 2000) is a widely used screening measure in bipolar disorder research. Although this measure assesses a heterogeneous range of content, only limited prior research utilizing relatively small sample sizes has examined its factor structure.
