This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We examined a medically validated measure of event severity in patients admitted to a Level I Trauma Center
- We examined multiple outcome measures at baseline, 3, 6, and 12 months post-injury
- We found that event severity was not significantly related to any of the outcomes at baseline, 3, and 6 months post-injury
- We found a very weak effect of event severity at 12 months post-injury
- We conclude that despite widespread belief to the contrary, the empirical evidence does not support a relationship between event severity and likelihood of elevated posttraumatic stress symptoms
