This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

A Cost-Sensitive Move Selection Strategy for Moving Target Defense

Vahid Zangeneh and Mehdi Shajari¹

Department of Computer Engineering and Information Technology, Amirkabir University of Technology

Vahid Zangeneh is a PhD candidate within the Department of Computer Engineering and Information Technology at Amirkabir University of Technology, Tehran, Iran. His PhD thesis is concerned with moving target defense. He received his BSc degree from Razi University, Kermanshah, Iran in 2010 and his MSc degree from Khaje Nasir Toosi University of Technology, Tehran, Iran in 2012.

Mehdi Shajari is an Assistant Professor in the Department of Computer Engineering and Information Technology at Amirkabir University of Technology, Tehran, Iran. He obtained his M.S. with honors in 1993 and received his Ph.D. degree in Computer Science in 2005. He worked with the National Research Council of Canada as a Research Officer and with Trent University as an Assistant Professor during 2001–2006. Dr. Shajari has extensive experience in IT industry and has successfully implemented many large scale projects. His current research interests include information security, information retrieval and electronic commerce.

Abstract

The effectiveness and the cost-sensitivity of moving target defense (MTD) strategies have not been studied thoroughly in previous research. In this paper, we propose a hybrid MTD model that considers the defender's preferences to shift the attack surfaces more effectively in a cost-sensitive manner by incorporating event- and time-based move selection engines. We model the protected system as a state machine where the states are the attack surfaces with their security levels which are determined by utilizing the Bayesian attack graph (BAG) as a dynamic risk assessment tool. In the event-based engine, the competitive Markov decision process (CMDP) is employed to find the proper moves for each possible state of the protected system. Moreover, the
