Abstract:

This paper presents a way to enhance student interest and learning when teaching economic inequality. The approach draws on a well-known survey conducted by Norton and Ariely (2011). The approach involves surveying students, asking them to estimate the current level of wealth inequality in the US, and asking them to state their ideal level of wealth inequality. As in Norton and Ariely's survey of a representative sample of Americans, our students underestimated actual wealth inequality and preferred a distribution of wealth for the US that was more equal than any country's distribution. We suggest ways the student survey results can be presented and discussed. We also provide Stata code and an Excel workbook to ease effective classroom presentation of the survey results. This approach to beginning the study of inequality piqued our students' interest and helped them understand how inequality is measured.

We thank Frederick Oerther and Mark Maier for helpful suggestions and McKena Miyashiro for excellent research assistance.
