This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We consider the problem of scheduling n jobs on m uniform machines.
- The jobs are subject to inclusive or tree-hierarchical processing set restrictions.
- We propose fast approximation algorithms to solve the problem.
- It is shown that the algorithms have a worst-case ratio no more than $4/3$.
- The $4/3$ bound is achievable in both cases.
