12 **Abstract**

13 Community energy system optimization model has great contribution to  
14 formulate community energy planning indexes. But an inappropriate response of  
15 uncertainty always makes such “optimal plan” work ended in nothing. It is still a  
16 herculean task to solve a hybrid programming model which contains stochastic and  
17 fuzzy parameters. In order to acquire more flexible and reliable energy planning  
18 indicators in a convenient way, a goal programming based model system (GPMS) is  
19 proposed to conduct dynamic variation analysis of community energy flow. GPMS  
20 contains general linear programming model, goal programming model and grey  
21 relational degree model for results analysis. General linear programming model is  
22 used to calculate optimal community energy flow on baseline situation. Deviation  
23 variables associated with each independent parameter and total fossil energy  
24 consumption (TFEC) are introduced in goal programming model. Many kinds of  
25 optimum community secondary energy flow maps can be acquired by adjusting the  
26 weight which has been given to TFEC’s deviation variables. The grey correlation
