Abstract: At present, China's carbon dioxide (CO₂) emissions ranked first in the world. Moreover, the CO₂ emissions in the manufacturing industry accounted for 55.0% of total CO₂ emissions. Thus, investigating the main driving forces of CO₂ emissions in this industry is crucial for reducing China's CO₂ emissions. The traditional estimation method can only get the “global” and “average” parameter estimation, but obscures the difference in the “local” parameter estimation across region. Geographically
