This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.
Highlights
• Using data from a population-based study of adults, we evaluated the ability of several measures of ovarian age to predict the onset of menopause.
• Among women aged 45-49 years, those with undetectable anti-Müllerian hormone concentrations had a 60% probability of menopause within 5 years.
• Among women aged 45-49 years, approximately one-third of women with no or just one antral follicle underwent menopause within 5 years.
• The concentration of follicle stimulating hormone had a non-linear relationship with the likelihood of menopause within 5 years.

Anti-Müllerian hormone, follicle stimulating hormone, antral follicle count, and risk of menopause within 5 years
