May 2016

We examine the hypothesis that fluctuations in the aggregate supply of bank loans influence the supply of new equity capital. Using residual lending standards as a clean measure of aggregate loan supply and a VAR framework to aid identification, we find that a one-standard-deviation shock to lending standards results in 15% fewer IPOs. Shocks elicit strong responses from IPO-firms that are highly dependent on external capital and increase the number of withdrawals, strengthening the interpretation that the above is driven by changes in the supply of equity. Our results suggest that credit conditions are important to a well-functioning IPO market.

Keywords: IPO volume, IPO withdrawal, credit constraints

This paper has benefited from comments and suggestions from Craig Brown, Craig Dunbar, Bill Francis, Sinan Gokkaya, Iftekhar Hasan, Kose John, Tim Loughran, Hoon Park, Sabuhi Sardarli, Keke Song, as well as workshop participants at the University of South Florida, the 2012 USF-UCF Conference, the 2013 Financial Management Association meetings, the 2013 Southern Finance Association meetings, and the 2014 Midwest Finance Association meetings.
