Numerical simulations of Holocene salt-marsh dynamics under the hypothesis of large soil deformations

C. Zoccarato, P. Teatini

PII: S0309-1708(17)30643-7
DOI: [10.1016/j.advwatres.2017.10.006](https://doi.org/10.1016/j.advwatres.2017.10.006)
Reference: ADWR 2969

To appear in: *Advances in Water Resources*

Received date: 22 June 2017
Revised date: 23 September 2017
Accepted date: 6 October 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A numerical model for the long-term marsh accretion and compaction is proposed.
- A 2D groundwater flow simulator is coupled to a 1D vertical geomechanical module.
- The mechanical compaction highly influences the marsh vertical dynamics.
