| 13 | Abstract: The operating efficiency, operating performance and service quality of a  |
| 14 | drainage enterprise are determined by its sustainable development level. Sustainable  |
| 15 | development is a dynamic process affected by many factors and their complicated   |
| 16 | interaction. Compared with regular assessment methods, which are usually static and   |
| 17 | discontinuous, this research applies the system dynamics (SD) method to study the   |
| 18 | dynamic process that controls the sustainable development of a drainage enterprise.   |
| 19 | This assessment can be achieved through building a dynamic feedback mechanism   |
| 20 | among operable factors, simulating the dynamic evolution process of each effect   |
| 21 | factor within a continuous time and combining a comprehensive assessment model. A   |
| 22 | case study is presented that can help drainage enterprise stakeholders to strategically   |
| 23 | understand the possible effects of policy implementation. In addition, three different  |
| 24 | sustainable development scenarios are presented, which were designed and simulated  |
| 25 | through the setting the key variables. These three variables are investment in  |
| 26 | environmental protection, wastewater treatment fees (yuan/m³) and the growth rate of  |
| 27 | wastewater treatment capacity. The assessment results show that long-term   |
| 28 | sustainable development of a drainage enterprise is best served by improving the  |
