This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Buffer monitoring-based tolerance limits for schedule control are proposed.
- The performance of these limits is compared to a widely used linear benchmark.
- The impact of buffer size and topological network structure is considered.
- Significantly less false signals are generated, resulting in a higher efficiency.
- For parallel project networks, the highest improvements are observed.
