## Abstract

Nowadays, *Agile Software Development* (ASD) is used to cope with increasing complexity in system development. Hybrid development models, with the integration of *User-Centered Design* (UCD), are applied with the aim to deliver competitive products with a suitable *User Experience* (UX). Therefore, stakeholder and user involvement during *Requirements Engineering* (RE) are essential in order to establish a collaborative environment with constant feedback loops. The aim of this study is to capture the current state of the art of the literature related to Agile RE with focus on stakeholder and user involvement. In particular, we investigate what approaches exist to involve stakeholder in the process, which methodologies are commonly used to present the user perspective and how requirements management is been carried out.

We conduct a *Systematic Literature Review* (SLR) with an extensive quality assessment of the included studies. We identified 27 relevant papers. After analyzing them in detail, we derive deep insights to the following aspects of Agile RE: stakeholder and user involvement, data gathering, user perspective, integrated methodologies, shared understanding, artifacts, documentation and Non-Functional Requirements (NFR). Agile RE is a complex research field with cross-functional influences. This study will contribute to the software development body of knowledge by assessing the involvement of stakeholder and user in Agile RE, providing methodologies that make ASD more human-centric and giving an overview of requirements management in ASD.

**Keywords:** systematic literature review, agile software development, requirements engineering, human-computer interaction, user-centered design
